- (a) *You may use the Normal Cumulative Distribution Function Table on page 11 to answer Question 14(a).*

LithiumCorp claims that the batteries it manufactures for mobile phones will last for at least 10 hours of continuous video streaming. The video streaming time for their batteries is normally distributed with a mean of 10 hours 15 minutes and a standard deviation of 30 minutes.

**3**

A potential customer, BananaPhones, will test 25 randomly selected batteries and if more than 50 percent of the batteries allow at least 10 hours of video streaming it will agree to purchase batteries from LithiumCorp.

Calculate the probability that LithiumCorp will be successful in supplying its batteries to BananaPhones. Give your answer correct to the nearest percent.

**5**

$$\frac{dV}{dt} = -h\sqrt{h}.$$

If a tank has a base with area 10 square metres and the initial height of the water is 4 metres, find how long it takes until the tank contains less than 1 litre of water.

**Question 14 continues on page 10**

## Question 14 (continued)

- (c) Charlie hits a tennis ball at an angle of  $45^\circ$  against a vertical wall 10 m away. The ball rebounds off the wall and passes directly over where it was first struck at point  $Q$ . The tennis ball is 1 m above the ground when Charlie hits it and has an initial speed of 20 m/s.

The position  $\underline{r}$  in metres of the ball  $t$  seconds after it is hit but before it hits the wall at  $P$  is given by the vector equation

$$\underline{r}(t) = \begin{pmatrix} 10\sqrt{2}t \\ 10\sqrt{2}t - 5t^2 + 1 \end{pmatrix}. \quad \text{Do NOT prove this.}$$

- |       |   |          |
|-------|---|----------|
| (i)   | Calculate the height at which the ball hits the wall.   | <b>1</b> |
| (ii)  | Find the velocity vector $\underline{v}(t)$ of the ball during its flight from Charlie to the wall.   | <b>1</b> |
| (iii) | Calculate the speed $U$ m/s and the angle $\beta$ at which the ball hits the wall.  | <b>2</b> |
| (iv)  | The ball rebounds off the wall at the same angle that it hits it, $\beta$ , but its speed is reduced so that it leaves the wall with an initial speed of $\frac{1}{\sqrt{2}}U$ m/s. | <b>3</b> |

Show that the  $y$ -coordinates of the points  $P$  and  $Q$  in the diagram above are equal. Assume the acceleration due to gravity is  $10 \text{ m/s}^2$ .

$$12e. 23^1 - 1 = 22 = 2 \times 11 \therefore \text{true for } n = 1$$

If true for  $n = k$ ,  $23^k - 1 = 11M$  for an integer  $M$  so  $23^k = 11M + 1$

$$\begin{aligned}
\therefore 23^{k+1} - 1 &= 23(23^k) - 1 \\
&= 23(11M + 1) - 1 \\
&= 11(23M) + 22 \\
&= 11(23M + 2)
\end{aligned}$$

and since  $23M + 2$  is an integer then it is true for  $n = k + 1$

Hence by the principle of mathematical induction it is true for all positive integers  $n$

14a.  $z = \frac{10-10.25}{0.5} = -0.5$  and so  $P(Z > -0.5) = P(Z < 0.5) = 0.6915$

$$\sum_{n=13}^{25} \binom{25}{n} 0.6915^n \times 0.3085^{25-n} \approx 0.977874 \approx 98\%$$

More accurately using the complementary error function instead of the table,

$$\sum_{n=13}^{25} \binom{25}{n} \left(1 - 0.5\operatorname{erfc}\left(\frac{0.5}{\sqrt{2}}\right)\right)^n \times \left(0.5\operatorname{erfc}\left(\frac{0.5}{\sqrt{2}}\right)\right)^{25-n} \approx 0.977851 \approx 98\%$$

Alternatively using the regularised incomplete beta function,

$$1 - 13\binom{25}{12} \int_0^{0.3085} t^{12}(1-t)^{12} dt \approx 0.977874 \approx 98\%$$

and more accurately with the complementary error function,

$$1 - 13\binom{25}{12} \int_0^{0.5\operatorname{erfc}\left(\frac{0.5}{\sqrt{2}}\right)} t^{12}(1-t)^{12} dt \approx 0.977851 \approx 98\%$$
