The lines are not parallel as $\begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \neq \begin{pmatrix} 1 \\ -2 \\ 1 \end{pmatrix}$ ✓

$= \dfrac{\left(1-\cos\frac{\pi}{11}\right)+i\sin\frac{\pi}{11}}{2\left(1-\cos\frac{\pi}{11}\right)}$

$\operatorname{Re}\left(\dfrac{1}{1-z}\right) = \dfrac{1-\cos\frac{\pi}{11}}{2\left(1-\cos\frac{\pi}{11}\right)}$

$= \dfrac{1}{2}$ (1)

$\operatorname{Re}\left(z+z^3+z^5+z^7+z^9\right)$

$= \cos\frac{\pi}{11}+\cos\frac{3\pi}{11}+\cos\frac{5\pi}{11}+\cos\frac{7\pi}{11}+\cos\frac{9\pi}{11}$ (2)

$\therefore$ Using a (i) and from (1) and (2)

$\cos\frac{\pi}{11}+\cos\frac{3\pi}{11}+\cos\frac{5\pi}{11}+\cos\frac{7\pi}{11}+\cos\frac{9\pi}{11} = \frac{1}{2}$

Alternative Solution 2:

$$\frac{1}{1-z} = \frac{1}{1-e^{\frac{\pi}{11}i}}$$

$$= \frac{1}{e^{\frac{\pi}{22}i}\left(e^{-\frac{\pi}{22}i} - e^{\frac{\pi}{22}i}\right)}$$

$$= \frac{e^{-\frac{\pi}{22}i}}{-2i\sin\frac{\pi}{22}}$$

$$= \frac{\cos\frac{\pi}{22} - i\sin\frac{\pi}{22}}{-2i\sin\frac{\pi}{22}}$$

$$= \frac{\cos\frac{\pi}{22}}{-2i\sin\frac{\pi}{22}} \times \frac{i}{i} + \frac{1}{2}$$

$$= \frac{\cos\frac{\pi}{22}}{2\sin\frac{\pi}{22}}\, i + \frac{1}{2}$$

$$\operatorname{Re}\left(\frac{1}{1-z}\right) = \frac{1}{2} \qquad (1)$$

$$\operatorname{Re}\left(z + z^3 + z^5 + z^7 + z^9\right)$$

$$= \cos\frac{\pi}{11} + \cos\frac{3\pi}{11} + \cos\frac{5\pi}{11} + \cos\frac{7\pi}{11} + \cos\frac{9\pi}{11} \qquad (2)$$

$\therefore$ From (1) and (2)

$$\cos\frac{\pi}{11} + \cos\frac{3\pi}{11} + \cos\frac{5\pi}{11} + \cos\frac{7\pi}{11} + \cos\frac{9\pi}{11} = \frac{1}{2}$$

Alternative Solution 3:

from (i)

$$z + z^3 + z^5 + z^7 + z^9 = \frac{1}{1-z}$$

$$\Rightarrow (1-z)(z + z^3 + z^5 + z^7 + z^9) = 1$$

$$z - z^2 + z^3 - z^4 + z^5 - z^6 + z^7 - z^8 + z^9 - z^{10} = 1 \checkmark$$

$$(z - z^{10}) + (-z^2 + z^9) + (z^3 - z^8) + (-z^4 + z^7) + (z^5 - z^6) = 1 \quad (1)$$

Now $z^{11} = -1$

$$z^{10} \times z = -1$$

$$z^{10} = \frac{-1}{z} = \frac{-1}{e^{\frac{\pi}{11}i}} = -e^{-\frac{\pi}{11}i}$$

$$z^2 = -\frac{1}{z^9} = -e^{-\frac{9\pi}{11}i}$$

$$z^8 = -\frac{1}{z^3} = -e^{-\frac{3\pi}{11}i}$$

$$z^4 = -\frac{1}{z^7} = -e^{-\frac{7\pi}{11}i}, \quad z^6 = -\frac{1}{z^5} = -e^{-\frac{5\pi}{11}i}$$

$\therefore$ (1) become

$$\left(e^{\frac{\pi}{11}i} + e^{-\frac{\pi}{11}i}\right) + \left(e^{-\frac{9\pi}{11}i} + e^{\frac{9\pi}{11}i}\right) + \left(e^{\frac{3\pi}{11}i} + e^{-\frac{3\pi}{11}i}\right) + \left(-e^{-\frac{7\pi}{11}i} + e^{\frac{7\pi}{11}i}\right) + \left(e^{\frac{5\pi}{11}i} - e^{-\frac{5\pi}{11}i}\right) = 1$$

$$2\cos\frac{\pi}{11} + 2\cos\frac{9\pi}{11} + 2\cos\frac{3\pi}{11} + 2\cos\frac{7\pi}{11} + 2\cos\frac{5\pi}{11} = 1$$

$$\left[\because e^{i\theta} + e^{-i\theta} = 2\cos\theta\right]$$

$$\Rightarrow \cos\frac{\pi}{11} + \cos\frac{3\pi}{11} + \cos\frac{5\pi}{11} + \cos\frac{7\pi}{11} + \cos\frac{9\pi}{11} = \frac{1}{2}$$

(a) A particle of mass $m\ kg$ is moving along the x *axis* under the action of the resisting force given by:

$$m\left(pv+v^2\right),$$

Initially, the particle is at $x=\ln 2$ and is travelling with velocity p m/s.

(i) Show that the displacement x of the particle is given by **2**

$$x=\ln\left(\frac{4p}{p+v}\right).$$

$$ma = -m(pv+v^2)$$

(iii) It took the particle $\frac{1}{2}\ln 2$ seconds to reach the point where $x = \ln 3$ meters. **2**

Find the value of p.

Using (i)

$\ln 3 = \ln\left(\frac{4p}{p+v}\right)$

$3 = \frac{4p}{p+v}$

$3p + 3v = 4p$

$3v = p$

$v = \frac{p}{3}$

Substitute $v = \frac{p}{3}$ and $t = \frac{1}{2}\ln 2$ into

$t = \frac{1}{p}\ln\left(\frac{p+v}{2v}\right)$ (using (ii))

$\frac{1}{2}\ln 2 = \frac{1}{p}\ln\left(\frac{p+\frac{p}{3}}{2\times\frac{p}{3}}\right)$

$\frac{1}{2}\ln 2 = \frac{1}{p}\ln\left(\frac{\frac{4p}{3}}{\frac{2p}{3}}\right)$

$\frac{1}{2}\ln 2 = \frac{1}{p}\ln 2$

$\frac{1}{2} = \frac{1}{p}$

(b) Let $I_n = \int_0^{\frac{\pi}{2}} \sin^{2n+3}\theta \cos^5\theta \ d\theta$, and $n = 0, 1, 2, ...$

(i) Prove that $I_n = \frac{n+1}{n+4} I_{n-1}$ for $n \geq 1$. **3**

Q16 (b)(i) ③

$$I_n = \int_0^{\frac{\pi}{2}} \sin^{2n+3}\theta \cos^5\theta \, d\theta$$

$$= \int_0^{\frac{\pi}{2}} \sin^{2n+2}\theta \sin\theta \cos^5\theta \, d\theta$$

$$= -\int_0^{\frac{\pi}{2}} \sin^{2n+2}\theta \left(\cos^5\theta(-\sin\theta)\right) d\theta$$

Let $u = \sin^{2n+2}\theta$, $v' = \cos^5\theta(-\sin\theta)$

$u' = (2n+2)\sin^{2n+1}\theta\cos\theta$, $v = \frac{\cos^6\theta}{6}$ ✓

$$I_n = -\left[\left[\sin^{2n+2}\theta \times \frac{\cos^6\theta}{6}\right]_0^{\frac{\pi}{2}} - \int_0^{\frac{\pi}{2}} (2n+2)\sin^{2n+1}\theta\cos\theta \times \frac{\cos^6\theta}{6} d\theta\right]$$

$$= -\left[\sin^{2n+2}\frac{\pi}{2} \times \frac{\cos^6\frac{\pi}{2}}{6} - \sin^{2n+2}0 \times \frac{\cos^6 0}{6}\right]$$

$$+ \frac{n+1}{3}\int_0^{\frac{\pi}{2}} \sin^{2n+1}\theta \cos^7\theta \, d\theta$$

$$= -[0-0] + \frac{n+1}{3}\int_0^{\frac{\pi}{2}} \sin^{2n+1}\theta \times \cos^2\theta \times \cos^5\theta \, d\theta$$

$$= \frac{n+1}{3}\int_0^{\frac{\pi}{2}} \sin^{2n+1}\theta (1-\sin^2\theta)\cos^5\theta \, d\theta$$

$$= \frac{n+1}{3}\left[\int_0^{\frac{\pi}{2}} \sin^{2n+1}\theta\cos^5\theta - \int_0^{\frac{\pi}{2}} \sin^{2n+3}\cos^5\theta \, d\theta\right]$$

$$= \frac{n+1}{3} I_{n-1} - \frac{n+1}{3} I_n$$ ✓✓

Realising that this is I_{n-1}

$$I_n + \left(\frac{n+1}{3}\right) I_n = \frac{n+1}{3} I_{n-1}$$

$$\left(\frac{3+n+1}{3}\right) I_n = \frac{n+1}{3} I_{n-1}$$

$$\left(\frac{n+4}{3}\right) I_n = \left(\frac{n+1}{3}\right) I_{n-1}$$

$$I_n = \frac{n+1}{n+4} I_{n-1}$$ ✓

Hence Proved

(ii) Prove that $I_n = \dfrac{1}{(n+4)(n+3)(n+2)}$. **3**

(b) ii) $I_n = \dfrac{n+1}{n+4} I_{n-1}$

$I_n = \dfrac{n+1}{n+4} \times \dfrac{(n-1)+1}{(n-1)+4} I_{n-2}$

$= \dfrac{n+1}{n+4} \times \dfrac{n}{n+3} I_{n-2}$

$= \dfrac{(n+1)n}{(n+4)(n+3)} \times \dfrac{(n-2)+1}{(n-2)+4} I_{n-3}$

$= \dfrac{(n+1)n(n-1)}{(n+4)(n+3)(n+2)} \times \dfrac{(n-3)+1}{(n-3)+4} I_{n-4}$

$= \dfrac{(n+1)n(n-1)\times(n-2)\times(n-3)\times \cdots \times 5\times4\times3\times2}{(n+4)(n+3)(n+2)(n+1)\times n \times \cdots \times 8\times7\times6\times5} I_0$ (*)

$I_0 = \int_0^{\frac{\pi}{2}} \sin^3\theta \cos^5\theta \, d\theta$

$= \int_0^{\frac{\pi}{2}} \sin\theta(1-\cos^2\theta)\cos^5\theta \, d\theta$

$= \int_0^{\frac{\pi}{2}} (\cos^5\theta - \cos^7\theta)\sin\theta \, d\theta$

$= \left[-\dfrac{\cos^6\theta}{6} + \dfrac{\cos^8\theta}{8}\right]_0^{\frac{\pi}{2}}$

$= \left(-\dfrac{\cos^6\frac{\pi}{2}}{6} + \dfrac{\cos^8\frac{\pi}{2}}{8}\right) - \left(-\dfrac{\cos^6 0}{6} + \dfrac{\cos^8 0}{8}\right)$

$= (-0+0) - \left(-\dfrac{1}{6} + \dfrac{1}{8}\right)$

$= \dfrac{1}{6} - \dfrac{1}{8}$

$= \dfrac{1}{24}$ ✓

(*) becomes

$I_n = \dfrac{(n+1)n(n-1)(n-2)(n-3)\times \cdots \times5\times4\times3\times2\times1}{(n+4)(n+3)(n+2)(n+1)n \cdots \times8\times7\times6\times5} \times \dfrac{1}{24}$

$= \dfrac{\cancel{(n+1)!}}{(n+4)(n+3)(n+2)\cancel{(n+1)!}}$ $\boxed{3}$

$= \dfrac{1}{(n+4)(n+3)(n+2)}$ Hence Proved ✓

(iii) Let $J_n = \int_0^1 x^{4n+7}\left(1-x^4\right)^2 \; dx$. **3**

Show that $J_n = \frac{1}{2} I_n$.

$$J_n = \int_0^1 x^{4n+7}(1-x^4)^2 \, dx$$

Let $x^2 = \sin\theta$ when $x=0$, $\theta = 0$

$2x\,dx = \cos\theta \, d\theta$ $x = 1$, $\theta = \frac{\pi}{2}$

$x\,dx = \frac{\cos\theta}{2} d\theta$

$$J_n = \int_0^1 x^{4n+6} \times x \,(1-x^4)^2 \, dx$$

$$= \int_0^1 (x^2)^{2n+3} \times (1-(x^2)^2)^2 \times x\,dx$$

$$= \int_0^{\frac{\pi}{2}} \sin^{2n+3}\theta \times (1-\sin^2\theta)^2 \times \frac{\cos\theta}{2} \, d\theta$$

$$= \frac{1}{2}\int_0^{\frac{\pi}{2}} \sin^{2n+3}\theta \,(\cos^2\theta)^2 \cos\theta \, d\theta$$

$$= \frac{1}{2}\int_0^{\frac{\pi}{2}} \sin^{2n+3}\theta \times \cos^4\theta \times \cos\theta \, d\theta$$

$$= \frac{1}{2}\int_0^{\frac{\pi}{2}} \sin^{2n+3}\theta \, \cos^5\theta \, d\theta$$

$$= \frac{1}{2} I_n$$
